

What is the most expensive battery metal in 2021?

Cobalt was by far the most expensive battery metal until late 2021, which was when lithium prices hit an inflection point, heading towards all-time highs. A single tonne of lithium carbonate, one of the refined forms of lithium that's used in batteries, now costs over \$80,000, up from around \$6,500 at the beginning of 2021.

What is the Fastmarkets battery Cost Index?

The Fastmarkets Battery Cost Index is an easy-to-use cost model for total cell costs, including cost breakdown of active anode material (AAM), cathode active material (CAM), separator, electrolyte, other materials, energy, labor and operational costs across multiple chemistries and geographies.

Why are battery prices so opaque?

Volatile battery raw material prices, varying battery chemistries and differing manufacturing costs result in cell prices that appear opaque and subjective. This makes it difficult for market participants to budget effectively, anticipate price changes, bring transparency to transactions and effectively track cost changes over time.

How much does a tonne of lithium carbonate cost?

A single tonne of lithium carbonate, one of the refined forms of lithium that's used in batteries, now costs over \$80,000, up from around \$6,500 at the beginning of 2021. Prices have been converted from Euro to USD as of Dec. 8, 2022.

Is the unit price of a battery cell based on factory size?

However, a high-volume market for all components of battery cells except cathode active material is assumed, meaning that the unit price of all components in a battery cell except cathode active material are independent of factory size. The latter approach is adopted in this work.
