

Can atmospheric nitrogen be used in a battery for next-generation energy storage?

Now, a group of researchers from the Changchun Institute of Applied Chemistry has outlined one way atmospheric nitrogen can be captured and used in a battery for next-generation energy storage systems. The "proof-of-concept" design reverses the chemical reaction that powers existing Lithium-nitrogen batteries.

Do lithium-nitrogen batteries have a new nitrogen conversion pathway?

We invoke a reaction in the water-containing battery where formation of lithium amide and lithium hydroxide is key. This finding suggests a new nitrogen conversion pathway in lithium-nitrogen batteries and will provide insight for further studies on metal-nitrogen batteries.

Can a lithium-nitrogen battery capture atmospheric nitrogen?

In the journal Chem on April 13, researchers in China present one approach to capturing atmospheric nitrogen that can be used in a battery. The "proof-of-concept" design works by reversing the chemical reaction that powers existing lithium-nitrogen batteries.

How does a lithium nitride battery work?

Instead of generating energy from the breakdown of lithium nitride into lithium and nitrogen gas, the battery prototype runs on atmospheric nitrogen in ambient conditions. This reacts with lithium to form lithium nitride. The energy output is comparable to other lithium-metal batteries, the authors said. [Subscribe to WIRED](#)

Can rechargeable lithium nitride batteries fix N₂ in ambient conditions?

"We have demonstrated that electrochemical N₂ fixation in ambient conditions is possible with rechargeable Li-N₂ batteries," the authors explained. Instead of generating energy from the breakdown of lithium nitride into lithium and nitrogen gas, the battery prototype runs on atmospheric nitrogen in ambient conditions.

Can lithium-nitrogen batteries deliver high energy densities?

Lithium-nitrogen batteries can deliver high energy densities using environmentally friendly and abundant nitrogen as a resource. According to previous studies, the nitrogen conversion pathway is expected to consist of formation and decomposition of lithium nitride. However, the reaction deserves more attention prior to forming a consensus.

Many works have been produced mainly on the synthesis of NG films using chemical vapor deposition (CVD) methods using methane or ethane as carbon sources and substances containing nitrogen atoms ...

The conversion of atmospheric nitrogen (N₂) into valuable substances such as fine chemicals and fertilizers is critical to industry, agriculture, and many other processes that sustain human life.

Now, a group of researchers from the Changchun Institute of Applied Chemistry has outlined one way atmospheric nitrogen can be captured and used in a battery for next-generation energy storage...

Instead of generating energy from the breakdown of lithium nitride ($2\text{Li}_3\text{N}$) into lithium and nitrogen gas, the researchers' battery prototype runs on atmospheric nitrogen in ...

The battery cell shell can play the role of transmitting energy, carrying electrolyte, protecting the safety of the battery, fixing and supporting the battery, therefore it is an important component to ensure the safety and stability of the battery [96]. At present, the mainstream battery shell materials include steel shell, aluminum shell and aluminum-plastic composite film ...

contamination with oxygen, water and nitrogen. After deposition the films are stored in air at ambient conditions. For the analyses described below pieces were cut from a single sample produced by sputtering. The samples were analysed by Grazing Incidence X-ray Diffractometry (Bruker D5000, a $\lambda = 0.15406$ nm, $\text{CuK}\alpha$ radiation). The

Fig. 1 illustrates the detailed synthetic process for the as-prepared sponge-like N-rGO film. As shown in Fig. 1 a, the melamine and PVP is used in the first and second steps of our experiments. The excessive melamine are first introduced into the GO solution, then a large quantities of suspension precipitate (the melamine-GO mixture) are produced for the ...

However, embedding the sulfur in nitrogen-rich networks can reduce these effects, making polymeric Schiff-bases an exciting solution for lithium-sulfur battery cathodes.

1 State Key Laboratory Cultivation Base for New Textile Materials and ... To overcome these challenges, we developed a nitrogen and sulfur co-doped carbon-encapsulated FeS composite with a hollow double-layer structure (HDL-FeS@NSC). Utilizing sulfur spheres as a sacrificial template, our inside-out synthesis strategy produces a unique material ...

Founded in 1979, Barzagli Generatori S.a.s. operates in the precision mechanics sector and has specialized in the construction of machinery for the production of non-cryogenic technical gases, such as Nitrogen and Oxygen. The company offers NITRO-GEN and OXY-GEN systems capable of producing nitrogen or oxygen completely independently. The nitrogen and oxygen ...

Further, nitrogen- and boron-doped graphene structures have attracted considerable interest in the field of electronics.^{26,28} Like other doped carbon forms, nitrogen-doped graphene is expected to have enhanced Li-battery properties.¹³ Reports on the synthesis of nitrogen-doped graphene are very scarce, and hence, developing a simple method to synthesize N-doped ...

This battery type mostly uses cathodes based on heavy metals such as cobalt and thus produces a severe negative impact on ... the often high nitrogen content of Schiff ...

A nitrogen-centered redox cycle operating between ammonia and nitrate via an eight-electron transfer as a catholyte was successfully implemented for Zn-based flow battery.

As a battery separator, these features significantly improve cell manufacturability and safety. Celgard MD + TD stretched base films are biaxially-oriented in the machine direction (MD) and transverse direction (TD) to add other unique and patented film and pore characteristics.

We bypass these obstacles by developing a Zn ion-exchange polymer membrane (Zn-MEM). The carbonyl oxygens and nitrogen in the polyimide backbone are coordinated to Zn $2+$ ions, providing high selectivity of Zn $2+$ ion transport and preventing the acid-base neutralization of electrolytes for the air cathode and Zn anode. Moreover, the high ionic ...

difficult to prepare, as the incorporation of nitrogen into the tungsten lattice is thermodynamic ally unfavourable at atmospheric pressure. 17 For this reason different high pressure and temperature
