

What is electric coolant pump?

Electric coolant pump and electric coolant circulation pumps are one of the main auxiliary devices that can be used to cool the power train components and other accessories such as cabin heating, battery cooling and electronic circuits cooling. Design process of electric coolant pump starts with the

How do electric coolant pumps work?

Efficient cooling is crucial, and electric coolant pumps provide a solution by circulating coolant fluid through the cooling system, facilitating heat dissipation. Electric coolant pumps are driven by electric motors, allowing precise electronic control and optimization of coolant flow rate based on cooling demands.

What is the design process of electric coolant pump?

Design process of electric coolant pump starts with the target requirement of flow input, which is used to calculate the torque, speed and power of the motor to arrive at the motor specifications. In this overview, the concept of radial field motor and claw pole motor are taken for study.

How does a battery cooling loop work?

For the battery cooling loop, driven by the pump, the coolant flows into the battery pack to absorb heat generated by the battery pack. Then the heat exchange process between the coolant and refrigerant will occur while the coolant flows into the Chiller.

Why do electric cars and hybrids need coolant pumps?

Electric vehicles and hybrids generate significant heat during operation, which can damage critical components like batteries, motors, and controllers if not managed effectively. Efficient cooling is crucial, and electric coolant pumps provide a solution by circulating coolant fluid through the cooling system, facilitating heat dissipation.

What voltage does an electric coolant pump use?

Electric coolant pumps typically operate within a voltage range of 12V or 24V for automotive applications. What is the range of flow rates for electric coolant pumps? The flow rate of electric coolant pumps can vary from a few liters per minute to over 100 liters per minute, depending on the application and cooling requirements.
