

Battery power is greater than the power of the optical storage device

What is the difference between solid state and optical storage?

X - Slower ACCESS SPEED than solid state but faster than optical storage. Optical storage uses a laser to project beams of light onto a spinning disc, allowing it to read data from a CD, DVD or Blu-Ray. This makes optical storage the slowest of the four types of secondary storage.

What is optical storage?

When the laser light hits the point where the pit changes into a land or vice versa the light scatters and is not reflected back as well. Zarmeen has purchased a new tablet computer. The tablet has an internal secondary storage device. The storage device is a solid state device.

What is power power?

Power Power is an important metric for a storage system Rate at which energy can be stored or extracted for use Charge/discharge rate Limited by loss mechanisms Specific power Power available from a storage device per unit mass

Which storage type has the highest capacity?

Rank magnetic, optical and solid-state storage in terms of capacity, durability, portability, speed and cost. For example, magnetic has the highest capacity, then solid-state, then optical. This could be completed in a table.

What type of storage does a device use?

Save to My Bitesize Save to My Bitesize Saving Saved Removing Remove from My Bitesize Some devices use magnetic or optical storage. Optical storage makes use of a laser to shine and reflect light to read the data stored. Examples include: Magnetic storage makes use of a magnetisable coating. Magnetised dots are made on the surface of the material.

Why do modern computers use solid state storage devices?

Modern computer systems, such as mobile phones and MP3 players, all make use of solid state storage devices. These have no moving parts, which means they can: Be smaller- devices they are in can be smaller too. Use less battery power - devices they are in stay charged for longer.
