

How does a battery safety valve work?

A safety valve was installed in the battery to prevent explosions due to excessive internal pressure. A battery tester (brand: NEWARE) overcharged the battery. Thermocouples measured the temperature. A decibel meter (brand: Delixi, model: DSM-D1) analyzed the opening duration of the battery safety valve , .

What is a battery valve?

A valve on each cell which automatically releases gas from the battery when internal pressure of the battery exceeds a predetermined value: it prevents breakage of the battery due to excessive internal pressure caused by the gas generated by charging or other reasons. The valve also serves to prevent outside air from entering batteries.

Does a safety vent affect the behavior of a battery?

Compared with the battery with a safety vent, the TR behaviors of the battery in the absence of a safety vent are greatly worsened with ignition and TR occurring far earlier. Yao et al. overviewed various safety valve designs in cylindrical LIBs and presented two case studies of safety valves that failed to operate properly.

What is a safety vent in a Li-ion battery?

A typical safety vent in a cylindrical Li-ion battery. The hollow arrows indicate the pathway to release the gases inside the battery .

What are the requirements for a stationary battery ventilation system?

Ventilation systems for stationary batteries must address human health and safety, fire safety, equipment reliability and safety, as well as human comfort. The ventilation system must prevent the accumulation of hydrogen pockets greater than 1% concentration.

Why do lithium ion batteries have safety vents?

Cylindrical Li-ion batteries (cells) typically have safety vents in the positive terminal to enable the release of gases that build up inside the battery and thus help reduce the effects of thermal runaway, including fire and explosion. However, the vents are not always effective, and it is critical to understand why.

The venting of safety valve was of great significance to the LIBs early warning system based on gas detection. In the TR process, the difference between the internal and external pressure of the battery was greater than the preset venting threshold of safety valve, which was the primary reason for the rupture of safety valve.
