

How does a voltage/current display module work?

The voltage/current display module works using the unregulated supply from the supply source without any issues (not to exceed 35V max), note the point E and F in the second figure above. In that case the bridge rectifier B1 can be eliminated. The system might be designed like a twofold to acquire concurrent V and I readings.

What is a battery design module?

The Battery Design Module contains lumped models that are physics-based and solve the electrochemical equations in multiple space dimensions. The Single Particle Battery interface models the charge distribution in a battery using one separate single-particle model each for the positive and negative electrodes of the battery.

What is a 5v-7v battery display range?
