## Can I add lead-acid batteries to increase battery life

How often should a lead acid battery be charged?

If at all possible,operate at moderate temperature and avoid deep discharges; charge as often as you can(See BU-403: Charging Lead Acid) The primary reason for the relatively short cycle life of a lead acid battery is depletion of the active material.

#### Why does a lead acid battery last so long?

The primary reason for the relatively short cycle life of a lead acid battery is depletion of the active material. According to the 2010 BCI Failure Modes Study, plate/grid-related breakdown has increased from 30 percent 5 years ago to 39 percent today.

#### When should you replace a lead-acid battery?

Once you're past that first stage in lead-acid battery life, you have up to 200 full cycles before gradual decline begins. However, you can continue using the battery until capacity drops to 70%. Depending on your application, you may then decide it is time to replace the battery.

How long does a lead-acid battery last?

As we exercise the plates by charging and discharging the battery, they absorb and release the electrolyte, becoming firmer in the process. This phase of lead-acid battery life may take twenty-to-fifty cycles to complete, before the battery reaches peak capacity (or room to store energy).

How does a lead-acid battery work?

We hope you find the information useful, and that we'll welcome you back again. When a lead-acid battery is new, the plates are somewhat like sponges surrounded by liquid electrolyte. As we exercise the plates by charging and discharging the battery, they absorb and release the electrolyte, becoming firmer in the process.
