

How to select capacitors?

Aside from the capacitance, another thing to consider on how to select capacitors is the tolerance. If your application is very critical, then consider a very small tolerance. Capacitors come with several tolerance options like 5%, 10% and 20%. It is your call which is which.

Can a capacitor be installed in series?

Though there are few cases to install a capacitor in series. In my designs, I am not allowing to a voltage stress of more than 75%. This means, if the actual circuit voltage is 10V, the minimum capacitor voltage I will select is 13.33V ($10V/0.75$). However, there is no such voltage. So, I will go to the next higher level that is 16V.

Which capacitor should be used for rectification?

For rectification, it requires most of the times a larger capacitance to get a near straight line voltage. Thus, the first option is to consider an electrolytic capacitor. In some applications that the ripple current is very high, electrolytic capacitor will not work anymore as its ripple current is smaller.

How to choose a film capacitor?

Thus, the first option is to consider an electrolytic capacitor. In some applications that the ripple current is very high, electrolytic capacitor will not work anymore as its ripple current is smaller. In this case, film capacitors are chosen as they are having very high ripple current rating.

Why do we need a parallel capacitor bank?

When we carry out inductive reactive power compensation, the incorporation of a parallel capacitor bank is logical to attenuate this demand in order to bring the demanded apparent power (kVA) nearer to the active power (kW) which is really used to carry out the purpose it is designed for.

What are the different types of capacitors?

Details can be viewed by clicking on the product types. The features of ceramic capacitors, aluminum electrolytic capacitors, and film capacitors vary as indicated below due to their differing dielectric materials and structures. *1 Type1 (temperature compensating) only

The selection of capacitor cabinets should consider the load type. Normally, the power factor compensation range of capacitor cabinets is 0.7 to 0.95. For users with purely resistive loads, just choose a capacitor cabinet with a higher power factor; if the load is capacitive load or For mixed loads, the power factor compensator needs to be selected according to the actual situation.

In actual configuration, the selection of internal components of the capacitor compensation cabinet is very important. The main switch should use a fuse-type knife switch with protection function to ensure system safety; the selection of capacitors needs to be reasonably configured according to the actual load conditions and installation location.
