

Can commercial capacitors be used as DC-BUS capacitors for EV traction inverters?

In this article, several commercial capacitor technologies are considered for use as dc-bus capacitors for EV traction inverters. They are characterized, evaluated, and compared for optimized design for volume reduction.

What is a capacitor used for?

They are suitable for applications that require high power density, high reliability, and high temperature performance, such as automotive, industrial, and telecom. Knowles and Cornell Dubilier Electronics (CDE) are two leading manufacturers of capacitors, offering a wide range of capacitor technologies and products.

What are the different types of capacitors?

Three common options--multilayer ceramic capacitors (MLCCs), film, or aluminum electrolytic--offer advantages and disadvantages, and there are myriad variations within each category. Choosing the right type ensures the final product has enough energy storage, fits in the available space, and functions reliably for its intended use.

Which film capacitors have high capacitance?

Among an extensive range of film capacitors, CDE's Type FCA acrylic film capacitors like the FCA0805C104M-J2 offer high capacitance values in standard surface mount case sizes. The series offers a capacitance range of 0.10 μ F to 1.0 μ F.

Can film capacitors be used for EV traction inverters?

Film capacitors are typically used, but other capacitor technologies with higher energy densities can help reduce the overall size. In this article, several commercial capacitor technologies are considered for use as dc-bus capacitors for EV traction inverters.

effects, the most appropriate design is done for the MEMS capacitor. The capacitor, required to be in direct coupling with the CSRR, is realised by the MEMS bridge on the resonator structure. The dimensions of this bridge are determined by the CSRR structure. 2.2 MEMS capacitor design The simplest MEMS bridge which made of the fixed-fixed beam

From Eqs. (2-4) and (2-5), it can be seen that in addition to the low-frequency fluctuating power $Q_1(t)$ and $Q_2(t)$ in the system, there is also the power $Q_e(t)$ generated by V_1 and I_1 , V_2 and I_2 . The active capacitors designed in this article use LCL filters that can eliminate reactive power at specific frequencies in the system without introducing additional ...
