

Does edge effect influence the electric field distribution of a cylindrical capacitor?

Abstract: The purpose of this paper is to show the influence of the edge-effect on the electric field distribution, and hence on the inner capacitance and outer capacitance of a cylindrical capacitor surrounded by an insulating medium.

Why are smaller capacitors more influenced by edge effects?

As expected, the capacitors with the smaller area are more influenced by the edge effects, which becomes dominated by the reduced linearity of the electric field vector.

Why does a capacitor have a high electric field?

It is necessary to notice that the electric field is very high in the edges of the capacitor. The reason of this increase is the edge effect: the surface charge density increases in the edges and this causes an increase on the electric field [19-21].

How can Weibull statistics be used to predict metallized capacitor failure?

Weibull statistics can also be used to predict the capacitance evolution of a metallized capacitor under electrical, thermal, and humidity stresses. In such cases, the failure definition will be, for example, 1% or 1%0 capacitance loss, depending on the available resolution of the measurement device.

Is capacitance loss linearly related to electrode evaporation area?

It was observed that capacitance loss is nonlinearly related to the total electrode evaporation area. Under single SH conditions, capacitance loss is determined by both the SH-breakdown film layers and the electrode evaporation area. Therefore, an improved equation for capacitance loss calculation was proposed;

What is mppfc capacitance evaluation?

In terms of MPPFC capacitance evaluation, Liu et al. measured the capacitance of capacitor elements in DC superimposed harmonic aging tests every 24 h, observing a decreasing trend in capacitance with increasing aging time and a rapid increase in the rate of decay with voltage [22,28].
