What are the parameters of a solar cell?

The solar cell parameters are as follows; Short circuit currentis the maximum current produced by the solar cell, it is measured in ampere (A) or milli-ampere (mA). As can be seen from table 1 and figure 2 that the open-circuit voltage is zero when the cell is producing maximum current (ISC = 0.65 A).

What is a solar PV module?

As shown in Fig. 4,the PV module consists of N solar cellsthat are placed in series or in parallel to generate a specific amount of voltage and current. The model of these solar cells is usually considered as SDM so that they are connected in series.

What is a photovoltaic module?

Photovoltaic modules (Figure 2) are interconnected solar cells designed to generate a specific voltage and current. The module's current output depends on the surface area of the solar cells in the modules. Figure 2. A flat-plate PV module. This module has several PV cells wired in series to produce the desired voltage and current.

Why do solar cells and modules need a datasheet?

An accurate and straightforward estimation of solar cells and modules parameters from the manufacturer's datasheet is essential for the performance assessment, simulation, design, and quality control.

What are the parameters of a solar cell under STC?

Under STC the corresponding solar radiation is equal to 1000 W/m2and the cell operating temperature is equal to 25oC. The solar cell parameters are as follows; Short circuit current is the maximum current produced by the solar cell, it is measured in ampere (A) or milli-ampere (mA).

How to estimate PV cell/module parameters?

Several methods have been proposed in the literature to estimate the parameters of PV cell/module. These methods are generally divided into two categories: deterministic and heuristic methods. Deterministic methods themselves are classified into analytical and iterative methods (Waly et al.,2019).
