How Is a Lead Sulfuric Acid Battery Charged? A lead sulfuric acid battery charges through a process called electrochemical reaction. This reaction involves two main components: lead dioxide (PbO<sub>2</sub>) at the positive plate and sponge lead (Pb) at the negative plate. The charging process occurs when an external voltage is applied to the battery.

They become more resistive as they are filled. A smart charger can completely fill a Lead Acid battery over time, far better than a split charger, as it uses different stages of charging. So with Lead Acid, a smart charger is used to keep the battery full. Adding a larger smart charger won't necessarily charge a Lead Acid battery faster.
