

## Convert the device battery to see how much current is best

How do you calculate the overall current of a battery?

The overall current is the sum of the current of each batteries, while the overall voltage remains the same. To connect batteries in parallel we connect all the positive terminals of the batteries together and all the negative terminals together too (See image above). To calculate the overall current we use the formula:  $I = I_1 + I_2 + I_3 + \dots + I_n$ .

How do you measure current across a battery?

You don't measure current across a battery like that because an ammeter setting is effectively short circuiting the battery. In this case you were lucky it was only an AA cell. Had it been a car battery you would certainly have blown the fuse and/or destroyed the meter. Current is measured in series with a load. Voltage is measured across.

How do I use a 9v battery?

You would connect your DC 9V source to a plug identical to the one coming out of the adapter and plug that into the power jack on the tablet. A small 9V battery is not sufficient. Your best bet would be a lithium battery. It would run fine off 3 18650 cells in series and a 9V switching regulator.

Is a 9v battery enough?

A small 9V battery is not sufficient. Your best bet would be a lithium battery. It would run fine off 3 18650 cells in series and a 9V switching regulator. You might even find a power bank already constructed that can supply 9V at that current.

How many volts are in a battery?

Remove and count the batteries in the device you're adapting. Standard dry-cell round batteries such as AAA, AA, C or D are all 1.5 volts. Multiply 1.5 by the number of batteries. So, four batteries would equal 6 volts; six batteries would equal 9 volts and so on.

How many volts are in a 4 volt battery?

Multiply 1.5 by the number of batteries. So, four batteries would equal 6 volts; six batteries would equal 9 volts and so on. Find the current or amp (mAh) rating either in the specification sheet in the device's manual or on a sticker on the device itself. This value is the current (mAh) for which the adapter should be rated.
