Are automakers making a solid-state battery?

A batch of automakers and battery firms have announced solid progress has been made in that direction. Battery maker Sunwoda told China Daily that it has finished R&D of its all-solid-state battery with an energy density of more than 400 Wh/kg, and plans to mass-produce it by 2026, with an estimated production capacity of 1 gigawatt-hour.

What is the difference between a lithium-ion battery and a solid-state battery?

Fig. 5. The difference between a lithium-ion battery and a solid-state battery. Conventional batteries or traditional lithium-ion batteries use liquid or polymer gel electrolytes, while Solid-state batteries (SSBs) are a type of rechargeable batteries that use a solid electrolyte to conduct ion movements between the electrodes.

What is a solid-state battery (SSB)?

The solid-state battery (SSB) is a novel technology that has a higher specific energy density than conventional batteries. This is possible by replacing the conventional liquid electrolyte inside batteries with a solid electrolyte to bring more benefits and safety.

Are solid-state batteries ready for production in 2025?

Solid-state batteries have long been touted as the technological breakthrough that electric car makers are striving to bring to market. Finally, it looks like 2025 could mark a crucial step on the technology's path to becoming ready for production.

What is a solid state battery?

In a solid-state battery, the make-up is simplified. The liquid is replaced by a solid block, which is lighter than its counterpart and can carry more energy within the same capacity. The solid element is also less reactive than the liquid, so it's much less likely to ignite if punctured or heated.

Are solid-state batteries a viable alternative to battery technology?

Solid-state batteries (SSBs) offer a promising alternative for revolutionizing battery technology for portable electronics and electric vehicles due to their superior energy density, power density, and safety features [4,5].
