

When did lithium-ion batteries become popular?

Fundamental works on lithium-ion batteries date from the 1970s, and remarkable progress has been made since the 1980s. The first commercial lithium-ion battery was issued in 1991, making it a rather short period of time between work in laboratories and the industrial production. In this review, we reported the main steps that led to this success.

When did lithium batteries come out?

Three important developments regarding lithium batteries occurred in the 1980s. In 1980, an American chemist, John B. Goodenough, discovered the LiCoO_2 (Lithium cobalt oxide) cathode (positive lead) and a Moroccan research scientist, Rachid Yazami, discovered the graphite anode (negative lead) with the solid electrolyte.

What is a lithium ion battery?

Lithium batteries are electrochemical devices that are widely used as power sources. This history of their development focuses on the original development of lithium-ion batteries. In particular, we highlight the contributions of Professor Michel Armand related to the electrodes and electrolytes for lithium-ion batteries.

What is the history of a battery?

The invention of the battery marks a pivotal moment in the evolution of technology, allowing for the storage and use of electrical energy in a controlled manner. This article delves into the fascinating history of the battery, highlighting key milestones and developments that have shaped our understanding of electrical storage and usage.

What is a lithium based battery used for?

The introduction of nickel and lithium based batteries in the latter half of the 20th century made the development of innumerable portable electronic devices feasible, from powerful flashlights to mobile phones. Very large stationary batteries find some applications in grid energy storage, helping to stabilize electric power distribution networks.

When was lithium discovered?

Introduction Lithium "lithion/lithina" was discovered in 1817 by Arfwedson and Berzelius by analyzing petalite ore ($\text{LiAlSi}_4\text{O}_{10}$), but the element was isolated through the electrolysis of a lithium oxide by Brande and Davy in 1821. It was only a century later that Lewis began exploring its electrochemical properties.

Overview20th century: new technologies and ubiquityInventionFirst practical batteriesRechargeable batteries and dry cellsSee alsoWaldemar Jungner patented a nickel-iron battery in 1899, the same year as his Ni-Cad battery patent, but found it to be inferior to its cadmium counterpart and, as a consequence, never bothered developing it. It produced a lot more hydrogen gas when being charged, meaning it could not be sealed, and the charging process was less efficient (it was, however, cheaper).
