When will battery energy storage systems (BESS) become more popular?

2024 was a record year for deployment of battery energy storage systems (BESS). We predict even higher implementation in 2025. A marked increase in the availability and use of second life batteries within the energy storage sector with EV manufacturers seeking to maximise the value of batteries.

Is battery energy storage the future of power systems?

The use of battery energy storage in power systems is increasing. But while approximately 192GW of solar and 75GW of wind were installed globally in 2022, only 16GW/35GWh (gigawatt hours) of new storage systems were deployed.

What is the future of battery storage?

Batteries account for 90% of the increase in storage in the Net Zero Emissions by 2050 (NZE) Scenario, rising 14-fold to 1 200 GW by 2030. This includes both utility-scale and behind-the-meter battery storage. Other storage technologies include pumped hydro, compressed air, flywheels and thermal storage.

Which year has the most new-build battery energy storage capacity?

Q3 2024 saw the highest amount of new-build battery energy storage capacity begin commercial operations in 2024 so far. At the end of Q3, total battery capacity in Great Britain stood at 4.3 GW with a total energy capacity of 5.8 GWh.

Should energy storage systems be mainstreamed in the developing world?

Making energy storage systems mainstream in the developing world will be a game changer. Deploying battery energy storage systems will provide more comprehensive access to electricity while enabling much greater use of renewable energy, ultimately helping the world meet its Net Zero decarbonization targets.
