

The practical energy density of lithium-sulfur batteries is limited by the low sulfur utilization at lean electrolyte conditions. The highly solvating electrolytes (HSEs) promise to address the issue at harsh conditions, but the conflicting challenges of long-term stability of radical-mediated sulfur redox reactions (SRR) and the poor stability with lithium metal anode ...

The Big Problem with Lithium-Sulfur Batteries. Lithium-sulfur batteries are far from a new idea, with the chemistry first being patented in 1962 by Herbert Danuta and Ulam Juliusz. There's a good reason they haven't had ...

Amorphous FePO₄ (AFP) is a promising cathode material for lithium-ion and sodium-ion batteries (LIBs & SIBs) due to its stability, high theoretical capacity, and cost-effective processing. However, challenges such as low electronic conductivity and volumetric changes seriously hinder its practical application. To overcome these hurdles, core-shell structure ...
