What are the components of solar thermal power systems?

In this paper, the main components of solar thermal power systems including solar collectors, concentrators, TES systems and different types of heat transfer fluids (HTFs) used in solar farms have been discussed. . Some of existing solar thermal power plants all over the world [26,27] Content may be subject to copyright.

What is solar thermal plant?

Solar thermal plant is one of the most interesting applications of solar energy for power generation. The plant is composed mainly of a solar collector field and a power conversion system to convert thermal energy into electricity.

How do solar thermal power plants work?

Solar thermal power plants are composed of three processes: collection and conversion of solar radiation into heat, conversion of heat to electricity, and thermal energy storage to mitigate the transient effects of solar radiation on the performance of the system.

What percentage of solar power plants use thermal energy storage systems?

Indeed, the share of the implemented thermal energy storage systems was estimated in 2019 to be 65.9% of the total installed capacity in operational and under-development concentrating solar power plants . One can distinguish three types of thermal energy storage technologies: sensible, latent, and thermo-chemical heat storage systems.

Which thermodynamic cycle is used for solar thermal power generation?

Rankine, Brayton, and Stirling cycle are commonly used thermodynamic cycles for solar thermal power generation. The integration of thermal energy storage and hybridization of solar thermal energy systems with conventional power generation systems improves the performance and dispatchability of the solar thermal systems.

How to compare the different solar thermal power generation systems?

To compare the different solar thermal power generation systems, some key characteristics/parameters are important to analyze the performance of the power generation system. Some of those parameters are discussed as follows: Aperture is the plane of entrance for the solar radiation incident on the concentrator.
