To achieve the ambitious goal of carbon neutrality, the development of electric vehicles (EVs) has become imperative. [1, 2] Lithium-ion batteries (LIBs) are the most widely used energy storage systems in EVs, considering its relative high energy/power density and long cycle life [3].However, range-anxiety and safety are often quoted among the main issues hindering ...

The numerous types of rechargeable secondary batteries have drawn significant attention, such as lithium-ion batteries (LIBs), aluminum-ion batteries (AIBs), magnesium-ion batteries (MIBs), sodium-ion batteries (SIBs), etc. LIBs have a better choice of power source in portable electronic devices due to their cyclic durability, high charge storage capacity, high ...

These energy sources are erratic and confined, and cannot be effectively stored or supplied. Therefore, it is crucial to create a variety of reliable energy storage methods along with releasing technologies, including solar cells, lithium-ion batteries (LiBs), hydrogen fuel cells and supercapacitors.

Lithium-ion batteries (LIBs) are extensively utilized in electric vehicles due to their high energy density and cost-effectiveness. LIBs exhibit dynamic and nonlinear characteristics, which raise significant safety concerns for electric vehicles.

Due to its high specific capacity, high energy density and good cycling stability, lithium ion battery (LIB) has the dominant share of the rechargeable batteries [7,8] and is widely applied in many area such as portable electronics (cell phones and tablets) [9], military [10], medical technology [11], electric and hybrid vehicles [12,13] and utility support [14].
