

Are lithium-ion batteries a fire risk?

Over the past four years, insurance companies have changed the status of Lithium-ion batteries and the devices which contain them, from being an emerging fire risk to a recognised risk, therefore those responsible for fire safety in workplaces and public spaces need a much better understanding of this risk, and how best to mitigate it.

Are lithium-ion batteries dangerous?

Lithium-ion batteries used to power equipment such as e-bikes and electric vehicles are increasingly linked to serious fires in workplaces and residential buildings, so it's essential those in charge of such environments assess and control the risks. Lithium-ion batteries are now firmly part of daily life, both at home and in the workplace.

Can You overcharge a lithium ion battery?

Do not overcharge batteries. Do not leave batteries connected to chargers after charging is complete. Proper lithium-ion battery storage is critical for maintaining optimum battery performance and reducing the fire and explosion risk.

Are lithium-ion batteries safe for e-bikes?

The GPRS states that the lithium-ion batteries used for e-bikes must contain a safety mechanism like a battery management system or an equivalent safety feature to address the risk of thermal runaway. A battery management system is commonly known for being the 'brain' of the battery pack.

Why are lithium-ion battery fires difficult to quell?

Due to the self-sustaining process of thermal runaway, Lithium-ion battery fires are also difficult to quell. Bigger batteries such as those used in electric vehicles may reignite hours or even days after the event, even after being cooled. Source: Firechief's Global

Are rechargeable lithium-ion batteries safe?

In the fast-paced nature of today's world, rechargeable lithium-ion batteries offer undeniable benefits and convenience, however, their potential risk for explosions and fire hazards cannot be ignored.
