

Are silicon-based lithium-ion battery anodes durable?

A comprehensive review of the lithium-ion battery anodes based on silicon is presented and discussed in terms of successful approaches leading to more durable silicon-based nanocomposite architectures that can potentially overcome the existing limitations of the silicon-based anodes.

Are silicon nanoparticles functional in lithium-ion batteries?

In the present work we demonstrate the characterization of silicon nanoparticles using small-angle neutron scattering and complementary microscopy to elucidate the structure changes through the ball milling process with respect to the particle's functionality in lithium-ion batteries.

Are carbon-free silicon-based anodes suitable for lithium-ion batteries?

Thus, carbon-free silicon-based anodes are discussed as an important approach toward development of the silicon-based anodes. The balance between the ionic and electronic conductivity in the lithium-ion battery anodes is emphasized with regard to the anode electrochemical performance.

Can silicon-core-carbon-shell nanoparticles replace graphite in lithium-ion batteries?

Cite this: Nano Lett. 2019,19,10,7236-7245 Silicon-core-carbon-shell nanoparticles have been widely studied as promising candidates for the replacement of graphite in commercial lithium-ion batteries. Over more than 10 years of R&D, the many groups actively working in this field have proposed a profusion of distinctive nanomaterial designs.

Are Si materials a promising anode compound for lithium-ion batteries?

Silicon-based materials are promising anode compounds for lithium-ion batteries. Si anodes offer a reduced lithium diffusion distance and improved mass transfer. Si nanomaterials are highly significant due to improved energy density and safety. An in-depth overview of Si materials, its synthesis techniques and trends are discussed.

Can silicon be used in lithium-ion batteries?

Silicon in the form of nanoparticles has attracted significant interest in the field of lithium-ion batteries due to the enormous capability of lithium intake. In the present work we demonstrate th...

<p>Silicon (Si) is considered a potential alternative anode for next-generation Li-ion batteries owing to its high theoretical capacity and abundance. However, the commercial use of Si anodes is hindered by their large volume expansion (~ 300%). Numerous efforts have been made to address this issue. Among these efforts, Si-graphite co-utilization has attracted attention as a ...

This paper presents the first extensive comparison of size/shape of nano-silicon (nanoparticles and nanowires)

used as anode materials in lithium-ion batteries. The main challenge was to obtain each nanomaterial with a good size and shape control, and in gram-scale quantities for reliable LiB electrochemical tests.

In the pursuit of achieving carbon neutrality, green energy storage systems play an indispensable role [[1], [2], [3]]. LIBs have emerged as a highly efficient and eco-friendly energy storage solution, garnering significant attention [[4], [5], [6], [7]]. With advantages such as high energy density and long cycle life, LIBs are extensively applied in electric vehicles, renewable ...

Milled flake graphite/plasma nano-silicon@carbon composite with void sandwich structure for high performance as lithium ion battery anode at high temperature Carbon, 130 (2018), pp. 433 - 440, 10.1016/j.carbon.2018.01.021

Silicon (Si) has emerged as a potent anode material for lithium-ion batteries (LIBs), but faces challenges like low electrical conductivity and significant volume changes during lithiation/delithiation, leading to material pulverization and capacity degradation. Recent research on nanostructured Si aims to mitigate volume expansion and enhance electrochemical ...

Silicon (Si) anodes for lithium-ion batteries (LIBs) have attracted extensive attention owing to their ultrahigh specific capacities [[1], [2], [3]]. However, the rapid capacity decay of Si-based anodes caused by dramatic volume change of Si when lithium ion (Li⁺) inserts into or extracts from Si hinders wider application of Si-based anodes for LIBs [4].

Silicon (Si) is considered a promising anode active material to enhance energy density of lithium-ion batteries. Many studies have focused on new structures and the ...
