

How can EV & battery development be a technology race?

Specifically, companies can perform combined thermal analysis and strength simulations at the system level to account for battery weight and structural integrity, which are crucial to protecting vehicle occupants and the battery in the event of a crash. "The Future of EV and battery development is going to be a technology race."

What is Altair battery design & simulation software?

From battery manufacturing to multiphysics system optimization, Altair's battery design and simulation software provides a holistic approach to battery-powered mobility. Connected multidisciplinary workflows enable product developers to balance competing technical requirements with performance, safety, and sustainability demands.

What is a battery management unit (BMU)?

A Battery Management Unit (BMU) is a critical component of a BMS circuit responsible for monitoring and managing individual cell voltages and states of charge within a Li-ion battery pack. The BMU collects real-time data on each cell's voltage and state of charge, providing essential information for overall battery health and performance.

What is the relationship between a battery and a structural design?

The relationship between the battery, its tray, and the vehicle's structural design plays a crucial role in determining EVs' weight and structural integrity.

Which topologies are faster in balancing the battery pack?

The proposed topologies are faster in balancing the battery pack compared to the existing research. In 39 an inductor-based cell balancing model with 4 cells, and 6 switches is proposed. The cell balancing process is designed from layer to layer in the model, it has taken 900 s to balance all the cells in the battery pack.

What is a 2RC equivalent circuit model for lithium-ion batteries?

In this work, a 2RC equivalent circuit model was chosen for modelling lithium-ion batteries due to its accuracy and computational efficiency. This model consists of two resistor-capacitor (RC) branches, which effectively capture the battery's dynamic behaviour, including voltage hysteresis and transient response.

1 State of the Art: Introduction 1.1 Introduction. The battery research field is vast and flourishing, with an increasing number of scientific studies being published year after year, and this is ...

In other words, even when the linked program is not consuming any energy, the battery, nevertheless, loses energy. The outside temperature, the battery's level of charge, the battery's ...

The inductor based ACB method utilizes an inductor for energy storage. By regulating the charging and discharging operations of the inductor, energy may be transferred from a battery with a higher ...

Shenzhen Yixiang New Energy Co., Ltd. is a professional lithium battery supplier specializing in new energy based in Shenzhen, China. Our management team has been working in the lithium ...

NUE leads the development and distribution of proprietary, state-of-the-art, ruggedized mobile solar+battery generator systems and industrial lithium batteries that adapt to a diverse set of ...

The four primary components of the battery pack's electrical safety design are the pre-charge circuit system, anti-collision design, high-voltage interlock safety, and ...

Analog or digital circuit design techniques to enable low-power systems; Ultra-low-power circuit designs for standby-mode operation; Energy-efficient circuit designs for ...

Tian et al. [21], [22] conducted an integrated thermal management system consisting of a heat pump air conditioning circuit, a motor circuit and a battery circuit, in which the motor circuit and the battery circuit are connected in parallel to two different heat exchangers in the heat pump air conditioning circuit through a plate heat exchanger, respectively. Different ...

In order to ensure good charging performance of new energy vehicles, the charging station was designed and the relevant oscillation circuits were optimized. The function ...

This webinar introduces a robust simulation-driven battery design and validation solution that incorporates the interaction with the battery management system. Altair's unique FE-based ...

In order to ensure good charging performance of new energy vehicles, the charging station was designed and the relevant oscillation circuits were optimized.

This paper investigates the current state of batteries and frames in new energy vehicles, summarizing and analyzing optimized design solutions that affect their performance and safety.

Passive cell balancing - energy is dissipated from the battery's most-charged cell in the form of heat, which may impact overall performance and efficiency. Active cell ...

As countries are vigorously developing new energy vehicle technology, electric vehicle range and driving performance has been greatly improved by the electric vehicle power system (battery) caused by a series of problems but restricts the development of electric vehicles, with the national subsidies for new energy vehicles regression, China's new energy vehicle ...

568 G. Ruan et al. Table 1. Material properties of the aluminum alloy box Material Elastic Poisson's Density
Yield strength model modulus [GPa] ratio [kg/m³] [MPa] 6061-T6 72 0.33 2800 276

These elements carry unequal energy among multiple cells, conveying unbalanced cell energy from higher energy cells to lower energy cells in the battery pack. ...
