The latter price is inversely proportional to the abundance of the raw material and the energy density (Wh/kg) of the active materials made thereof. A higher energy density cathode or anode implies a lower cost for the processing, production, and recycling of a battery pack with a given capacity.

The volumetric energy density of NMC 811 cells is around 60% higher than LFP cells, however, the cost is around 20% more (per kWh). If it is assumed that the cells make up 30% of a battery pack's volume (typical for earlier EV models), then for a 60kWh NMC 811 battery, it would take up around 300L.
