Can hard carbon be used as negative electrode in sodium ion batteries?

When used as the negative electrode in sodium-ion batteries, the prepared hard carbon material achieves a high specific capacity of 307 mAh g⁻¹ at 0.1 A g⁻¹, rate performance of 121 mAh g⁻¹ at 10 A g⁻¹, and almost negligible capacity decay after 5000 cycles at 1.0 A g⁻¹.

Can a mixed composite electrode be used for a sodium-ion battery negative electrode?

In this work, we show the benefit of a mixed composite electrode containing ionic and electronic conducting additives for a sodium-ion battery negative electrode. Hard carbon electrodes with 5 % additive containing different proportions of zeolite and carbon black are coated.

Which electrode material should be used for sodium ion batteries?

Among the most promising technologies aimed towards this application are sodium-ion batteries (SIBs). Currently, hard carbon is the leading negative electrode material for SIBs given its relatively good electrochemical performance and low cost.

Do n-doped hard carbon structures improve the performance of sodium-ion batteries?

Therefore, N-doped hard carbon structures greatly enhance the rate performance of sodium-ion batteries (capacity of 192.8 mAh g⁻¹ at 5.0 A g⁻¹) and cycling stability (capacity of 233.3 mAh g⁻¹ after 2000 cycles at 0.5 A g⁻¹).
