

Reactive power compensation capacitor experimental method

Can capacitive reactive power be used to regulate voltage?

This article presents an efficient voltage regulation method using capacitive reactive power. Simultaneous operation of photovoltaic power systems with the local grids induces voltage instabilities in the distribution lines. These voltage fluctuations cross the allowable limits on several occasions and cause economic losses.

How many capacitors are in a hybrid reactive power compensation system?

The circuit diagram of compensation capacitors and peripheral hardware in the implemented hybrid reactive power compensation system is also given in Fig. 7. As can be seen in this figure, there are six single-phase and two three-phase capacitors. Rated powers of each capacitor are also shown in the same figure.

What is hybrid reactive power compensation?

The hybrid system has been tested by experimental works. Test results have shown the proposed hybrid reactive power compensation method has better performance than conventional systems with switched capacitor and ensure to reach almost unity power factor even under unbalanced load conditions.

1. Introduction

How does a capacitor switched compensation system work?

The controller, after some calculations, decides on the capacitor stages closest to these powers and activates them. However, after the capacitors are switched on/off, unlike conventional capacitor switched compensation systems, the reactive powers drawn from each phase of the grid must be of the same type.

How is capacitive reactive power produced?

The capacitive reactive power is generated through the capacitance producing devices serially or shunt connected to a load,. A significant amount of studies was devoted to the methods to produce reactive power, such as DSTATCOMs, STATCOM, and real electrical capacitors.

What is the solution for concentrated reactive power compensation?

Solution 1 (S1): concentrated reactive power compensation with capacitor banks. Solution 2 (S2): distributed reactive power compensation with capacitor banks. Solution 3 (S3): concentrated reactive power compensation with harmonic filters. Solution 4 (S4): distributed reactive power compensation with harmonic filters.
