To achieve a high energy saving from solar cooling systems, the following things are needed to develop: (i) solar cooling system should be simple; (ii) the system should be in the optimum size of all components and including for the efficient backup auxiliaries when the sun is unavailable; (iii) all auxiliary segments, including fans and pumps should be working in high ...

Indirect liquid cooling is a heat dissipation process where the heat sources and liquid coolants contact indirectly. Water-cooled plates are usually welded or coated through thermal conductive silicone grease with the chip packaging shell, thereby taking away the heat generated by the chip through the circulated coolant [5]. Power usage effectiveness (PUE) is ...

Solar energy is harvested by photovoltaic panels (PV) and/or solar thermal panels in buildings [9]. The amount of energy gained is heavily affected by the extent of solar radiation, which varies strongly through the globe, and it is limited by the relative geographical location of the earth and sun and different months [10]. PV panels are generally made up of two different ...

Solar energy is a widely considerable, viable, and clean source of energy because of its abundance, scalability, and zero environmental pollution. Solar energy can be captured by employing special types of solar collectors such as a flat plate, evacuated tube, parabolic trough, and solar tower power plant [12, 13]. These are the most common ...
