

Solar system and household electricity connection

Can a solar PV system connect to a domestic electrical supply?

Solar energy, a clean and renewable source of power, is becoming increasingly popular for domestic use. Many homeowners are curious about how they can integrate solar photovoltaic (PV) systems into their existing electrical setup. In this blog, we will guide you through the process of connecting a Solar PV system to your domestic electrical supply.

How does a solar power system work?

Depending on your chosen setup, you may have to connect the solar battery and inverter to your circuit breaker panel and fuse box to run into the home. Each connection in the breaker box will connect to different sections of your home, allowing you to send power from the solar power system into your entire house.

Why should a solar PV system be connected to the grid?

For financial benefit. Connecting your solar PV system to the grid allows you to take advantage of the FIT, which gives you a fixed amount of money for each kWh of electricity you generate. On top of these payments for energy generation, you also receive a sum of money for feeding any surplus energy into the grid.

Can solar power be used as a home energy source?

Solar power is increasingly gaining popularity as a reliable and clean energy source for the home. Initially, you may find solar cells expensive, so you may use them in conjunction with your existing grid-power electricity to meet your home's energy requirements.

How to connect solar panels together?

After learning about the parts of a Solar PV System, let's talk about how to connect the solar panels together. This process is called wiring. You can connect solar panels in two ways: in a line (series) or side-by-side (parallel). In a series, you join the end of one panel with the start of the next one.

Can solar power be energy-independent?

Solar power provides an excellent path to becoming energy-independent. With a grid-tied solar power system, you can supply electricity to your home through the local utility infrastructure. In some cases, you can even generate extra energy and sell it back to the utility through net metering.
