Can solid-state battery technology improve flight safety?

"This milestone marks a significant achievement in the development of solid-state battery technology for eVTOLs, further enhancing flight safety while also substantially improving the aircraft's endurance and operational efficiency," commented Zhao Wang, COO of EHang.

Why is solid-state battery technology important for eVTOLs?

This milestone marks a significant achievement in the development of solid-state battery technology for eVTOLs, further enhancing flight safety while also substantially improving the aircraft's endurance and operational efficiency. Additionally, it reduces maintenance costs and expands the possibilities for future operational scenarios.

Does Ehang eVTOL have a solid-state battery?

EHang showcases its EH216-S eVTOL at the China Import Expo in Shanghai earlier this month. On Wednesday, EHang successfully tested the solid-state battery on the EH216-S, achieving a continuous flight time of 48 minutes and 10 seconds--nearly double the previous 25-minute maximum endurance estimate for the aircraft.

Can solid-state battery technology be used in eVTOL applications?

EHang's success in this test not only underscores the promising future of solid-state battery technology but also opens new avenues for eVTOL applications in areas such as urban air mobility (UAM), firefighting, and aerial logistics.

Why is Ehang a breakthrough in solid-state battery technology?

Lin Chen, Chairman of Inx, remarked, "We are extremely proud of this breakthrough in solid-state battery technology with EHang. This achievement is a significant step forward in the R&D of high-energy density battery, demonstrating our firm commitment to being at the forefront of clean energy technology innovation.

What is an electric vertical takeoff and landing aircraft?

Electric vertical takeoff and landing aircraft have a unique duty cycle characterized by high discharge currents at the beginning and end of the mission (corresponding to takeoff and landing of the aircraft) and a moderate power requirement between them with no rest periods during the mission.

TrendForce's latest investigations reveal that the development of flying cars and electric vertical take-off and landing aircraft (eVTOL)/urban air mobility (UAM) vehicles are ...

Passenger electric vertical take-off and landing (eVTOL) vehicles have gained attention recently as a solution for intercity transport, reducing carbon emission, congestion and journey times. ... While the geometry of

The perspectives of purely-battery eVTOL aircraft are discussed in many works, such as Refs. [[21], [22], [23]], neglecting the existence of alternatives such as plug-in hybrid eVTOL which presently gives huge advantages not expected to be voided by the next decade. While Ref. [22] concludes that battery packs suitable for a flight of specific energy ...
