Thermal Expansion Coefficient of Solar Energy Equipment

Do solar cell encapsulants have thermal expansion behavior?

It could be shown that knowing the thermal expansion behavior of the solar cell encapsulants is highly relevant for the PV module lamination process, and Thermo-Mechanical Analysis proved to be a suitable method to evaluate and also for quality control of solar cell encapsulation . 1. Introduction

Why is high dimensional stability important in photovoltaic module production?

High dimensional stability of the encapsulant is of great importance in photovoltaic (PV) module production to avoid problems during lamination and/or in application. For this purpose, the samples were heated twice in a thermo-mechanical analyzer (TMA) in tensile mode, and the coefficient of thermal expansion (CTE) over temperature was evaluated.

How was thermal expansion characterized?

The thermal expansion behavior was characterized by thermo-mechanical analysis (TMA). TMA was done in tensile mode using a Mettler Toledo TMA/SDTA 840 (Schwerzenbach,CH). The measurements were all performed under air atmosphere, with the first and second heating runs of each sample carried out according to the parameters given in Table 3.

Why do thermal expansion curves differ between encapsulants?

The difference in the thermal expansion behavior between the first and the second heating curves can possibly be attributed to orientations not being fully relaxed and/or movement of the plasticizer in the material. We took as the comparative factor for all encapsulants studied the CTE values of 25-55°C.

Are thermoplastic solar cell encapsulants ionomers?

Regarding thermoplastic solar cell encapsulants, except for ionomers, almost no data has been published so far . During its service time, a PV module undergoes diurnal and seasonal thermal cycles; the different thermal expansion behavior of the components of a PV module results in internal stresses , , .

Does the anisotropic and negative coefficient of thermal expansion affect thermomechanical stress?

The anisotropic and negative coefficient of thermal expansion (CTE) of polymer films is a well-known phenomenon in polymer engineering ,but the influence on the thermomechanical stress in PV modules has not yet been investigated. From our knowledge,all FEM models use an isotropic and temperature independent CTE for the backsheet.

The second reason is thermal expansion of both solid and liquid phases separately, where thermal expansion coefficient for the liquid phase was found to be 0.0005 K -1 in case of the same mentioned material (RT28HC) [38], which is relatively small value if compared to the expansion coefficient during phase change. The coefficient of thermal expansion is a ...
