

As an important component of the microgrid, the ESS helps to regulate the DC voltage and control the various energy disturbances due to the integration of RES in the grid (Erdiwansyah and Husin, 2021). ESSs are relevant to store excess power when it is lower than the load demand, where they act as a buffer between variable renewable generation and transient ...

Many scholars have studied the optimal scheduling methods for microgrid systems with electric vehicles. Shaolin Wang et al. [6] proposed an orderly charge and discharge scheduling strategy based on the state of charge (SOC) of electric vehicles. Taking the minimization of the total operation cost in the dispatching period as the objective function, the ...

In this paper, we study the optimal configuration problem of battery energy storage (BES) for multi-energy microgrid (MEMG) in two typical modes, which considers ...

Microgrid systems, electric vehicles and portable devices need batteries as storage devices and power sources. Therefore, battery management system (BMS) is critical for maintaining optimum battery performance. In this paper, a BMS designed for a battery system of a small microgrid system in Taiwan is described. To validate the concept, a scale-down ...

In developing a microgrid system, two main approaches can be used: i.e. by using either AC or DC electricity. With distributed energy resources like renewable energy, DC microgrid seems to have more advantages compared to AC microgrid [19, 20] especially for remote areas where the electricity demand is low. The advantages stem from the fact that AC electricity has frequency ...

Connecting multiple heterogeneous MGs to form a Multi-Microgrid (MMG) system is generally considered an effective strategy to enhance the utilization of renewable energy, reduce the operating costs of MGs by sharing surplus renewable energy among them, and generate income by selling energy to the main grid (Gao and Zhang, 2024). Hence, MMGs are proposed to ...
