SOLAR PRO. What are the detection methods for solar cell cracks

What is solar cell micro crack detection technique?

Solar cell micro crack detection technique is proposed. Conventional Electroluminescence(EL) is used to inspect the solar cell cracks. The techniques is based on a Binary and Discreet Fourier Transform (DFT) image processing models. Maximum detection and image refinement speed of 2.52s has been obtained.

Can micro cracks be detected in solar cells?

This would limit the detection area up to 90%, and it is quite complex in terms of the technique application, especially using micro cracks inline detection that is incorporated within the solar cells' manufacturing system, since main electrical parameters such as open circuit voltage and fill factor are required.

How accurate is crack detection for solar cells?

An accurate and robust crack detection scheme for solar cells is proposed. A novel steerable evidence filter is developed to provide evidence for crack. The intensity of crystal grains and crack is similar in electroluminescence images. The scheme is robust to heterogeneously textured background made by crystal grains.

Can El imaging detect cracks in solar cells?

According to Fig. 9,a solar cell sample has been observed using EL imaging technique. As noticed, multiple cracks appear in the EL image, where in fact, the detection of the cracks have been improved using the proposed algorithm.

Why do we need multiple crack-free and cracked solar cell samples?

Multiple crack-free and cracked solar cell samples are required to for the training purposes. The technique uses the analysis of the fill-factor and solar cell open circuit voltage for improving the detection quality of PL and EL images. The technique needs further inspection of the solar cell main electrical parameters.

Can computer vision detect cracks in solar cells?

Hence, computer vision-based techniques for automatic crack detection in solar cells are emerging. In practical application, solar cells images are the main data source for crack detection. However, some tiny cracks are inside the wafer surface.

To improve solar cell micro-crack detection, the authors used a low-cost CCD camera setup with an ORing method to detect the crack in the image obtained during the inspection phase. Each pixel in the test image is compared to the entire cell image, and only the necessary crack is detected, leaving the unnecessary noise and background behind.
