What is a battery separator?

The battery separator is one of the most essential components that highly affect the electrochemical stability and performance in lithium-ion batteries. In order to keep up with a nationwide trend and needs in the battery society, the role of battery separators starts to change from passive to active.

What are the different types of battery separators?

Li-ion battery separators may be layered, ceramic based, or multifunctional. Layered polyolefins are common, stable, inexpensive, and safe (thermal shutdown). Ceramic oxides reduce shrinkage and particle penetration and improve wetting. Chemically active multifunctional separators may trap, attract, or disperse ions.

Are battery separators active or passive?

In order to keep up with a nationwide trend and needs in the battery society, the role of battery separators starts to change from passive to active. Many efforts have been devoted to developing new types of battery separators by tailoring the separator chemistry.

Why is a battery separator important?

The major role of the battery separator is to physically isolate the anode from the cathode while allowing mobile Li-ions to transport back and forth. Unfortunately, two technical challenges associated with separator puncture and significant thermal shrinkage of polymer separators threaten the overall safety of batteries.

How have lithium metal battery separators evolved over time?

The literature on lithium metal battery separators reveals a significant evolution in design and material over time. Initially, separators were basic polymer films designed for lithium-ion batteries, focusing primarily on preventing short-circuits and allowing ionic conductivity [1].

Can a multifunctional separator be used in a Li-ion battery separator?

Multifunctional separators offer new possibilities to the incorporation of ceramics into Li-ion battery separators. SiO₂ chemically grafted on a PE separator improves the adhesion strength, thermal stability (<5% shrinkage at 120 °C for 30 min), and electrolyte wettability as compared with the physical SiO₂ coating on a PE separator.
