

What can scrapped energy storage charging piles be used for

How to manage power battery recycling?

Establish a comprehensive management platform for national detection of new energy vehicles and power battery recycling and traceability, and collect the whole process from power battery production to recycling. Establish the power battery recycling system, explore the formation of power battery recycling and create a business cooperation model.

Can partial charge curves be used to estimate charging capacity?

Some researchers have used the translation and transformation of partial charge curves to estimate the capacity [1, 2, 3]. However, this route is only for the charging strategies with a constant current and constant voltage. Actual vehicles generally use a multistage constant-current charging strategy.

Why should a battery pack be separated?

Because the performance of a battery pack is determined by the worst battery, separating retired LIBs and regrouping batteries with the same or similar performance is necessary to extend the service life and improve the safety and economy of echelon utilization.

How does sorting and regrouping a battery affect echelon utilization?

Sorting and regrouping batteries increase the cost of testing and labor, which affects the economy of echelon utilization. In addition, the rationality and accuracy of the sorting and regrouping seriously affect the safety of the echelon utilization and length of the remaining service life.

How a cloud platform can improve battery management?

Uploading and storing battery data on a cloud platform not only facilitates accurate monitoring during their service but also facilitates rapid and accurate sorting of retired LIBs. Big data-driven life-cycle health assessment and optimized management of LIBs will be an important trend in the future.
