What is a sodium sulfur battery?

A sodium-sulfur (NaS) battery is a type of molten-salt battery that uses liquid sodium and liquid sulfur electrodes. This type of battery has a similar energy density to lithium-ion batteries, and is fabricated from inexpensive and low-toxicity materials.

Is sulfur conversion reversible in room-temperature sodium-sulfur battery with carbonate-based electrolyte?

A complete reaction mechanism is proposed to explain the sulfur conversion mechanism in room-temperature sodium-sulfur battery with carbonate-based electrolyte. The irreversible reactions about crystal sulfur and reversible two-step solid-state conversion of amorphous sulfur in confined space are revealed.

Why are sodium sulfur batteries more economical?

Like many high-temperature batteries, sodium-sulfur cells become more economical with increasing size. This is because of the square-cube law: large cells have less relative heat loss, so maintaining their high operating temperatures is easier. Commercially available cells are typically large with high capacities (up to 500 Ah).

How much energy does a sodium-sulfur battery use?

At 350 °C, the specific energy density of the battery reached 760 Wh/kg, which is approximately three times that of a lead-acid battery. As a result, sodium-sulfur batteries require approximately one-third of the area needed for lead-acid batteries in identical commercial applications.

Does a room-temperature sodium-sulfur battery have a high electrochemical performance?

Herein, we report a room-temperature sodium-sulfur battery with high electrochemical performance and enhanced safety by employing a "cocktail optimized" electrolyte system, containing propylene carbonate and fluoroethylene carbonate as co-solvents, highly concentrated sodium salt, and indium triiodide as an additive.

What is the reactivity of the electrodes in a sodium-sulfur battery?

The high reactivity of the electrodes in a sodium-sulfur battery can be achieved by operating the battery at temperatures ranging from 300 to 350 °C, where both sodium and sulfur, along with the reaction product polysulfide, exist in the liquid state [37, 38].
